aimsio

Assignment: Resume > jSON > HTML

Pretext

Aimsio digitizes all the client's paper forms, both in terms of data and also html files that look identical to their paper forms. This way, it is super easy for the field users to quickly verify the information on their forms, as the only thing that changes is data entering into an iPad instead of using a pen.

Requirements

The assignment requires you to re-create your resume in an html file. Here are more specific details:

1. Convert your resume into a jSON object.
2. Use jQuery and write a function that gets the above jSON object as its input and generates HTML code that looks like your original resume.
3. You can use Twitter Bootstrap or any other library to help with the design of the html page.
4. BONUS 1: Make sure the resume still looks good when printed using the browser.
5. BONUS 2: Put your picture data in the jSON object and show it on the html page.

Please treat this assignment as though it is a real world example, and when in doubt simply state any assumptions you have made along the way.

Now show us what you've got!
